

New Flavours in Galactic Surveys: HOPS and MALT

Andrew Walsh,
Centre for Astronomy
James Cook University

Outline

- Basic data collected for HOPS
- Some interesting first results from HOPS
 - * The CMZ and star formation
 - * An extreme young high mass cluster
 - * Followup of water masers at high resolution
- MALT-45 Pilot survey
 - * Survey design
 - * CS (1-0) autocorrelation data
 - * New CH₃OH and SiO masers

HOPS – The H₂O southern Galactic Plane Survey

Andrew (Is it beer time yet?) Walsh, JCU
Steven (Hoots Man!) Longmore, ESO
Cormac (MopraBoy) Purcell, Leeds
Michael (The Bloodnut) Burton, UNSW
Nadia (Lo-Lo) Lo, U Chile
Kate (El Presidente) Brooks, ATNF
Chris (VLBIBoy) Phillips, ATNF
Shari (Shazaaaahh) Breen, ATNF
Lyshia (The Teacher) Quinn, Manchester
Maxim (PlaneBoy) Voronkov, ATNF
Maria (QuietGirl) Cunningham, UNSW

Paul (NoisyBoy) Jones, UNSW
James (Hames) Urquhart, ATNF
Melvin (Pommie Bastard) Hoare, U. Leeds
Mark (Pommie Bastard) Thompson, U. Hertfordshire
Lisa (Pommie Bastard) Harvey-Smith, ATNF
Tui (Kiwi Bastard) Britton, Macquarie/ATNF
Luke (Pommie Bastard) Hindson, Hertfordshire/ATNF
Jimi (WorldBeer) Green, ATNF
Vicki (GeeThreeThreeThree) Lowe, UNSW/ATNF
Balt (Baltipoos) Indemuehle, ATNF

AIMS

- Survey the southern Galaxy with Mopra at 12mm
- Use MOPS zoom
- 100 square d
- $l=290^\circ - 30^\circ$;

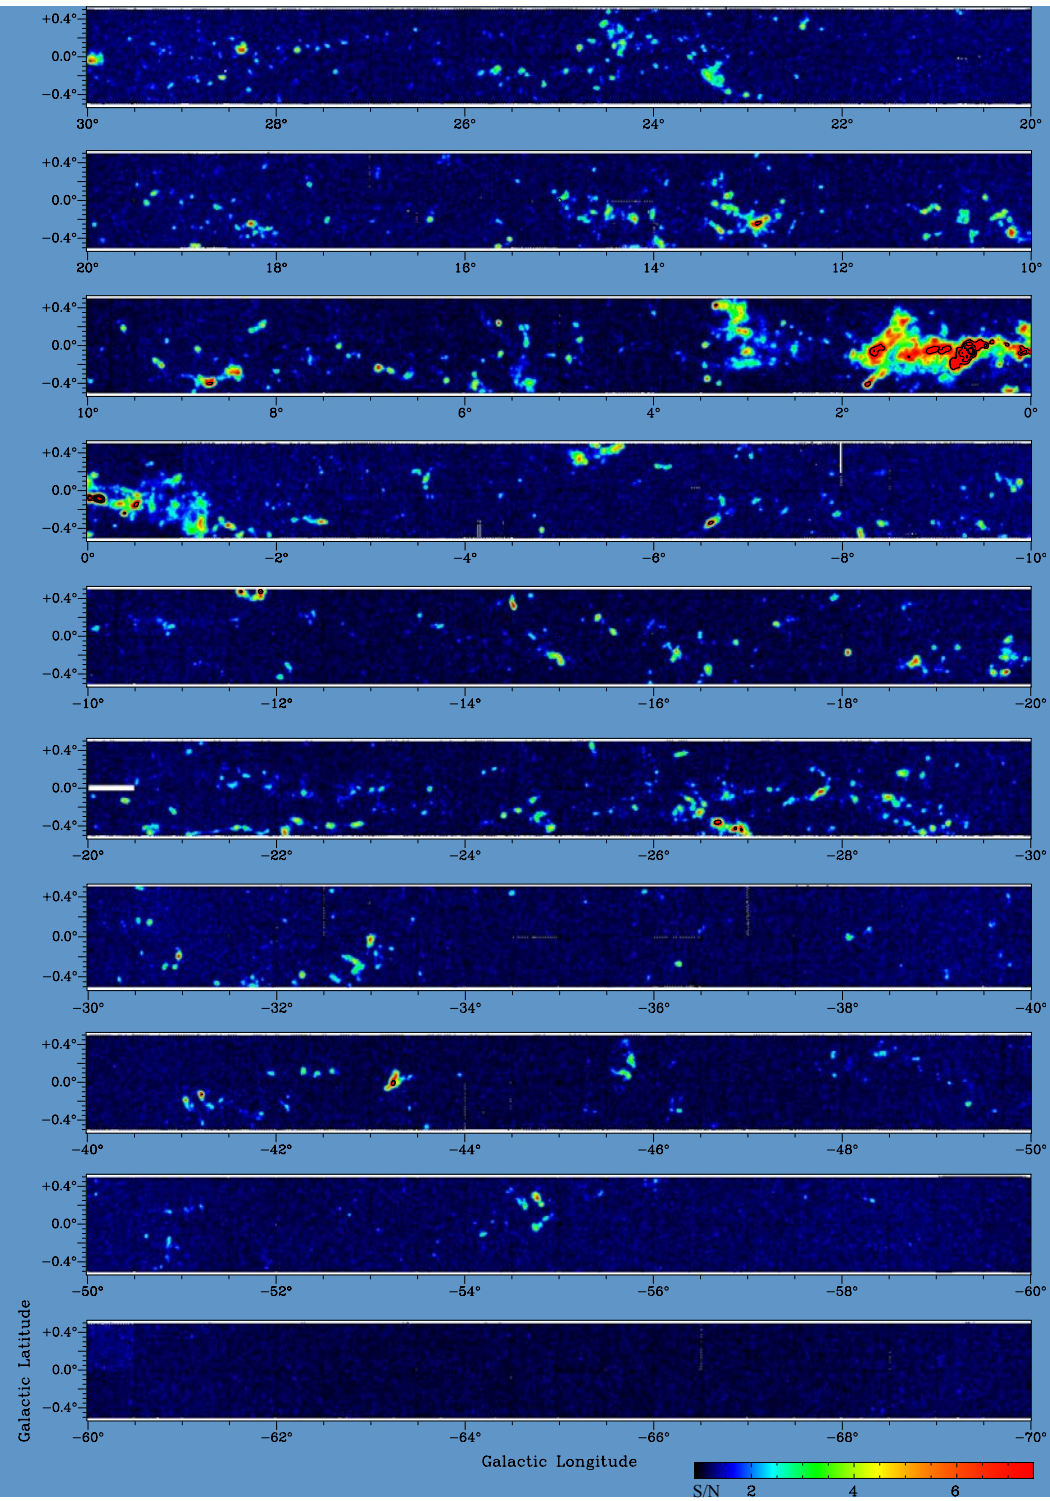

Main lines surveyed

- H₂O maser
- NH₃ (1,1), (2,2), (3,3), (6,6), (9,9)
- HC₃N (3-2)
- H69 α radio recombination line
- Many CH₃OH lines
- Many others including H62 α , H64 α , H65 α , NH₃ (non-metastable), CCS, HC₅N

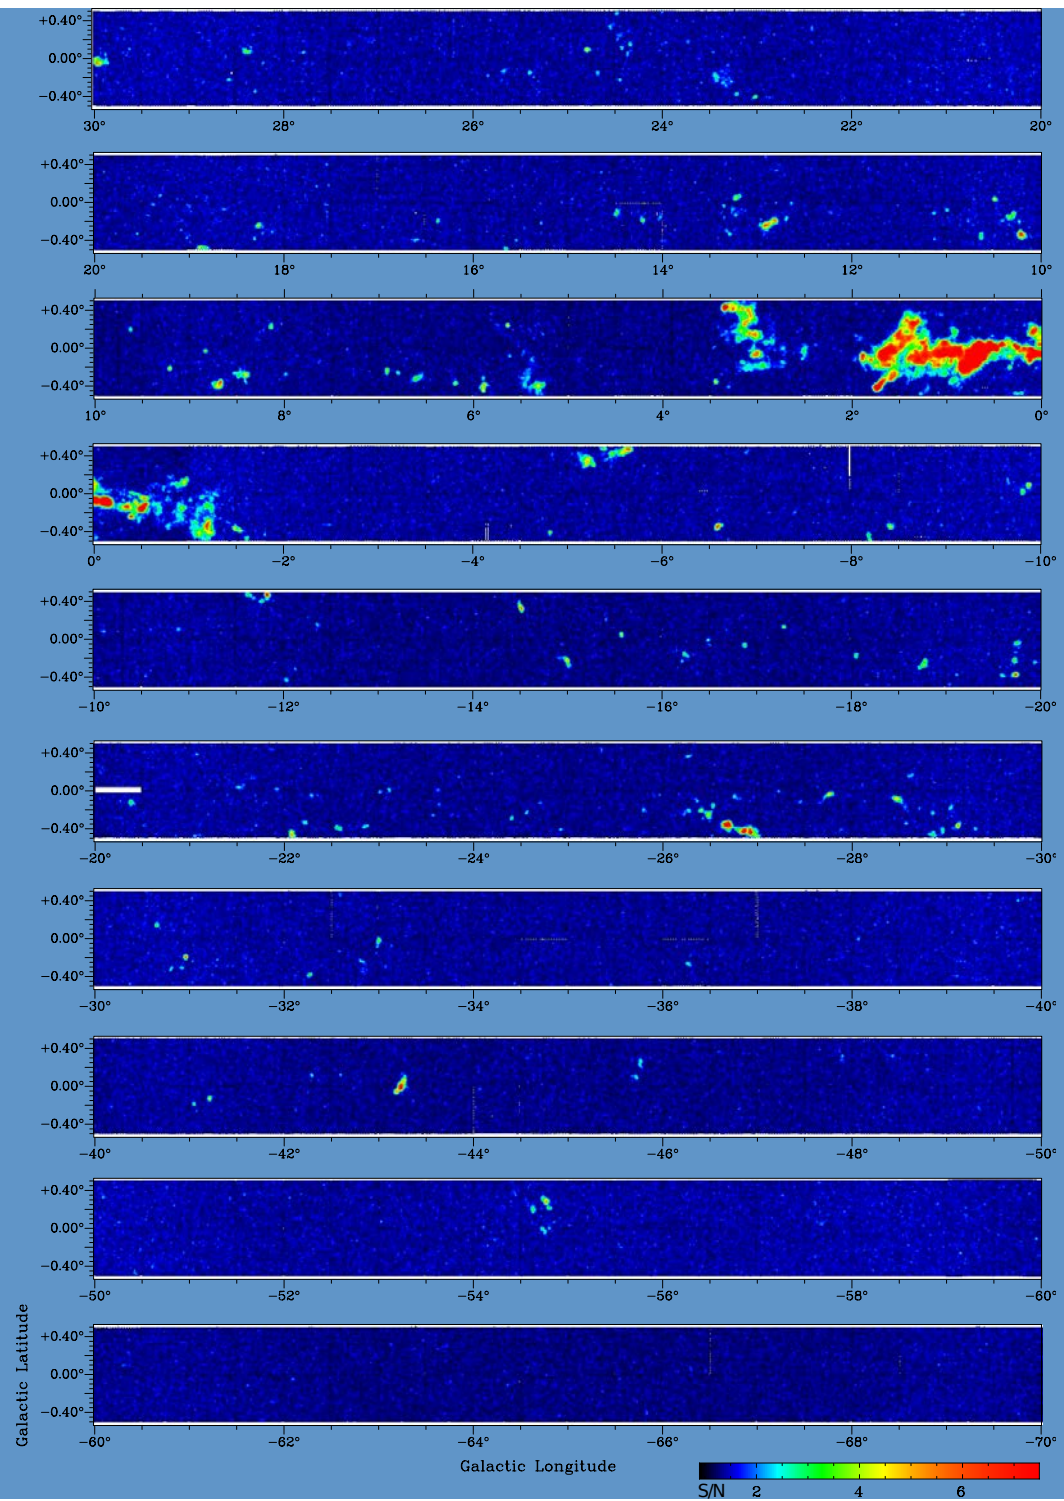

NH₃ (1,1) Emission Peak Temperature Maps

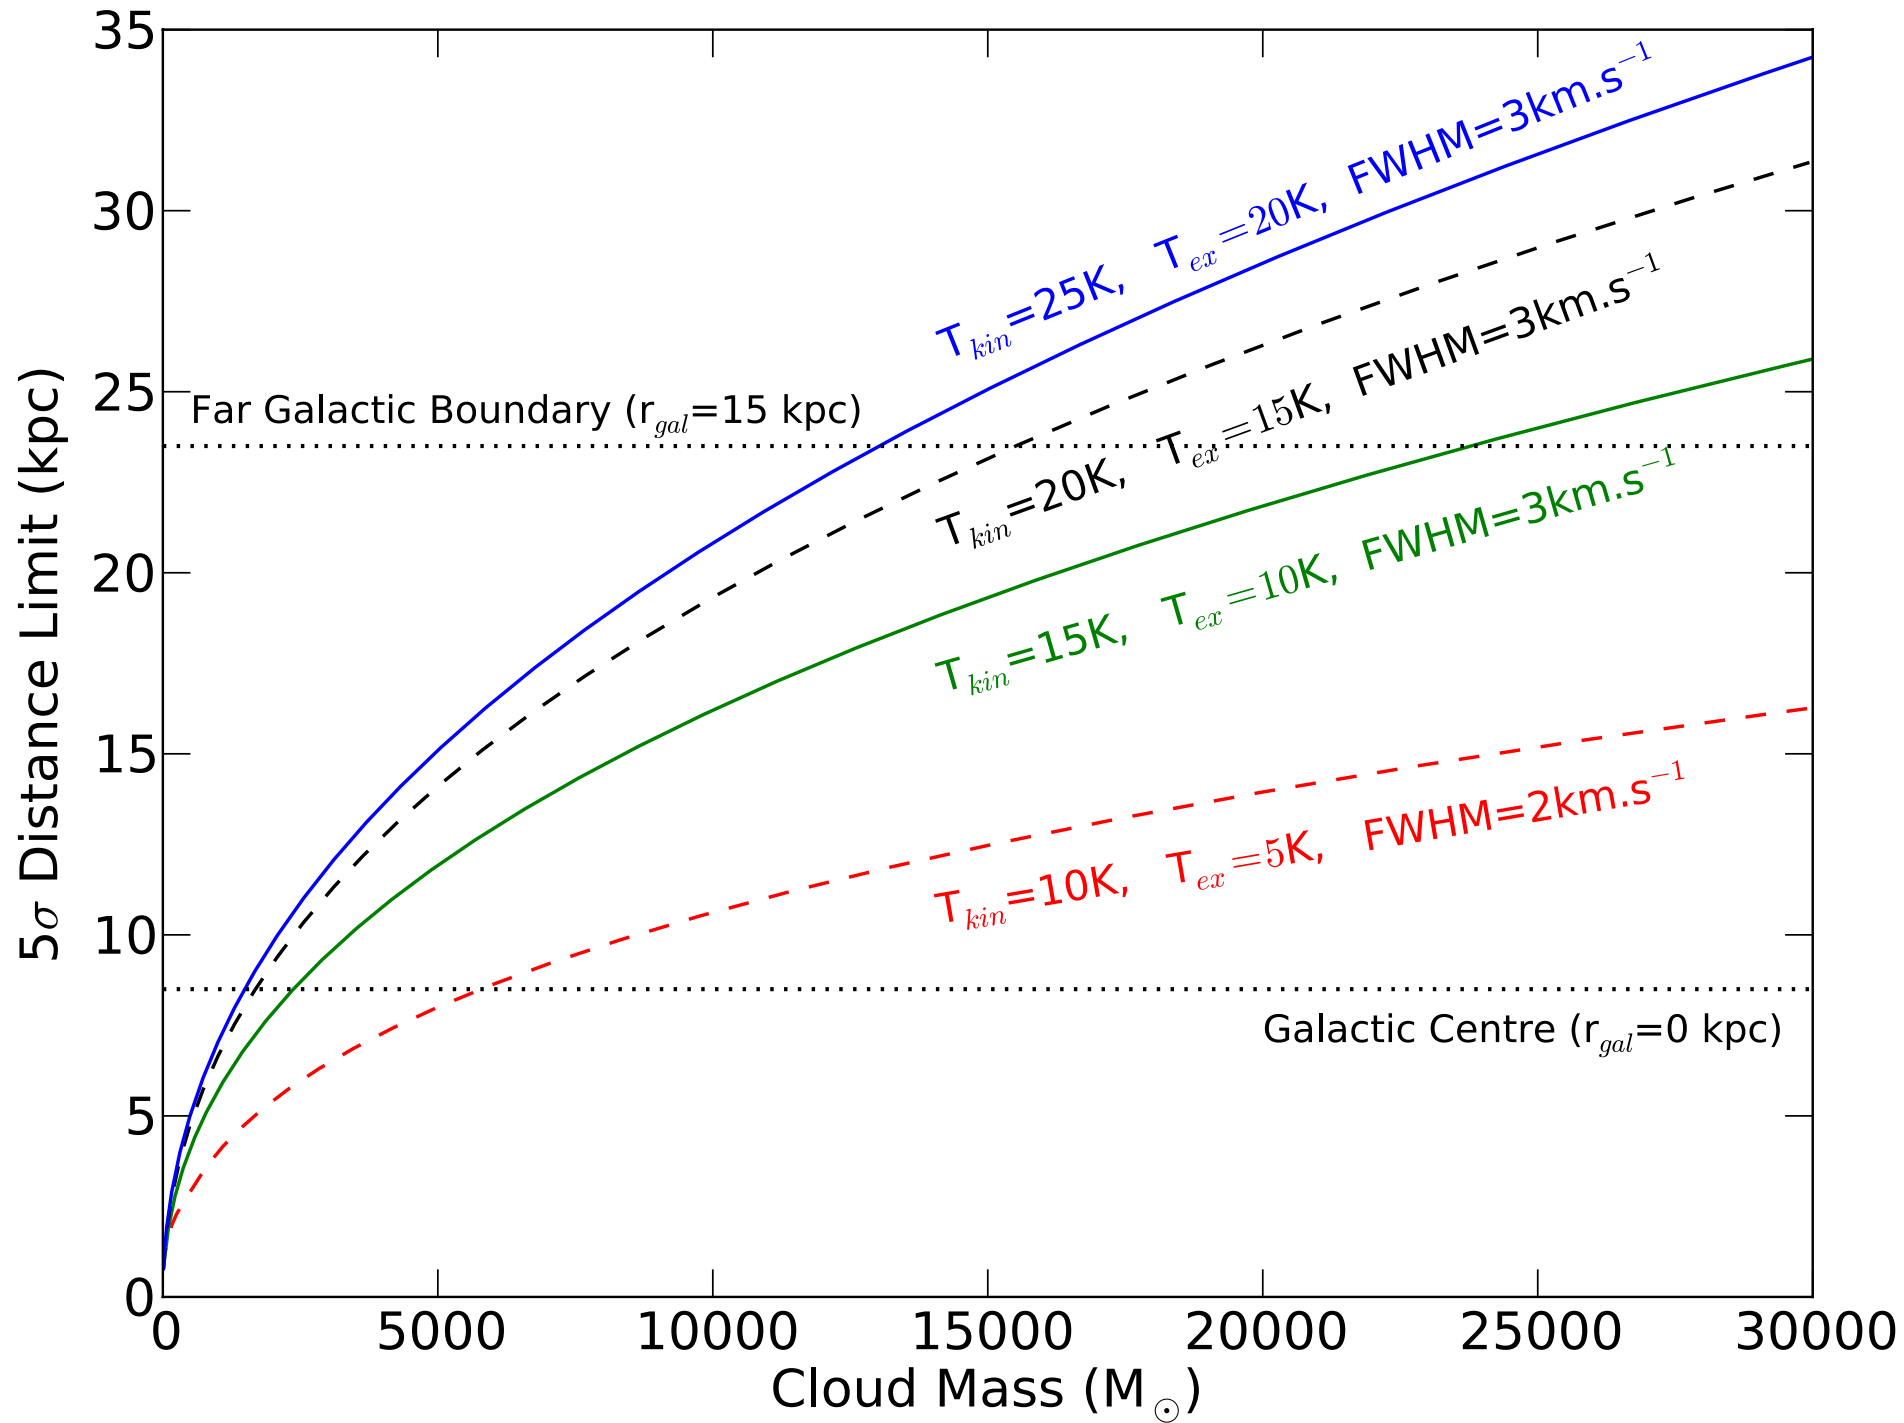

NH₃ (1,1)

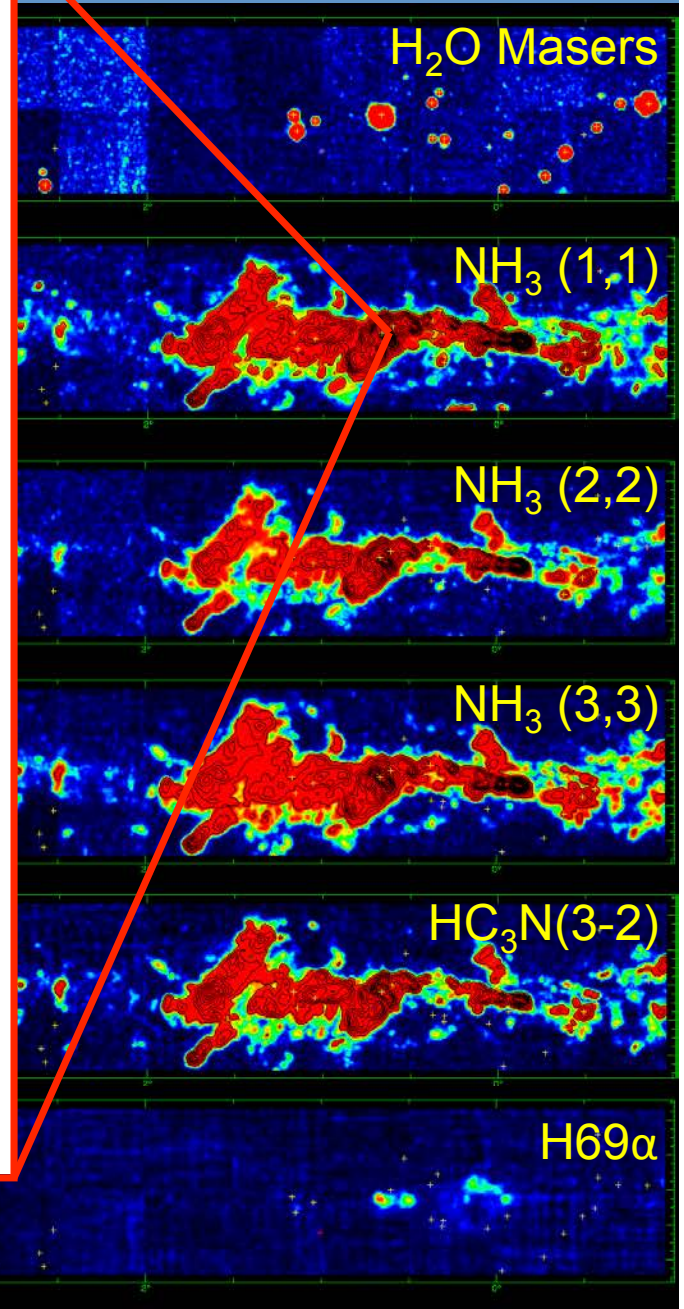

NH₃ (2,2)

$l=359-010^\circ$

Sgr B2

Hot gas emission in the CMZ

NH_3 (6,6)

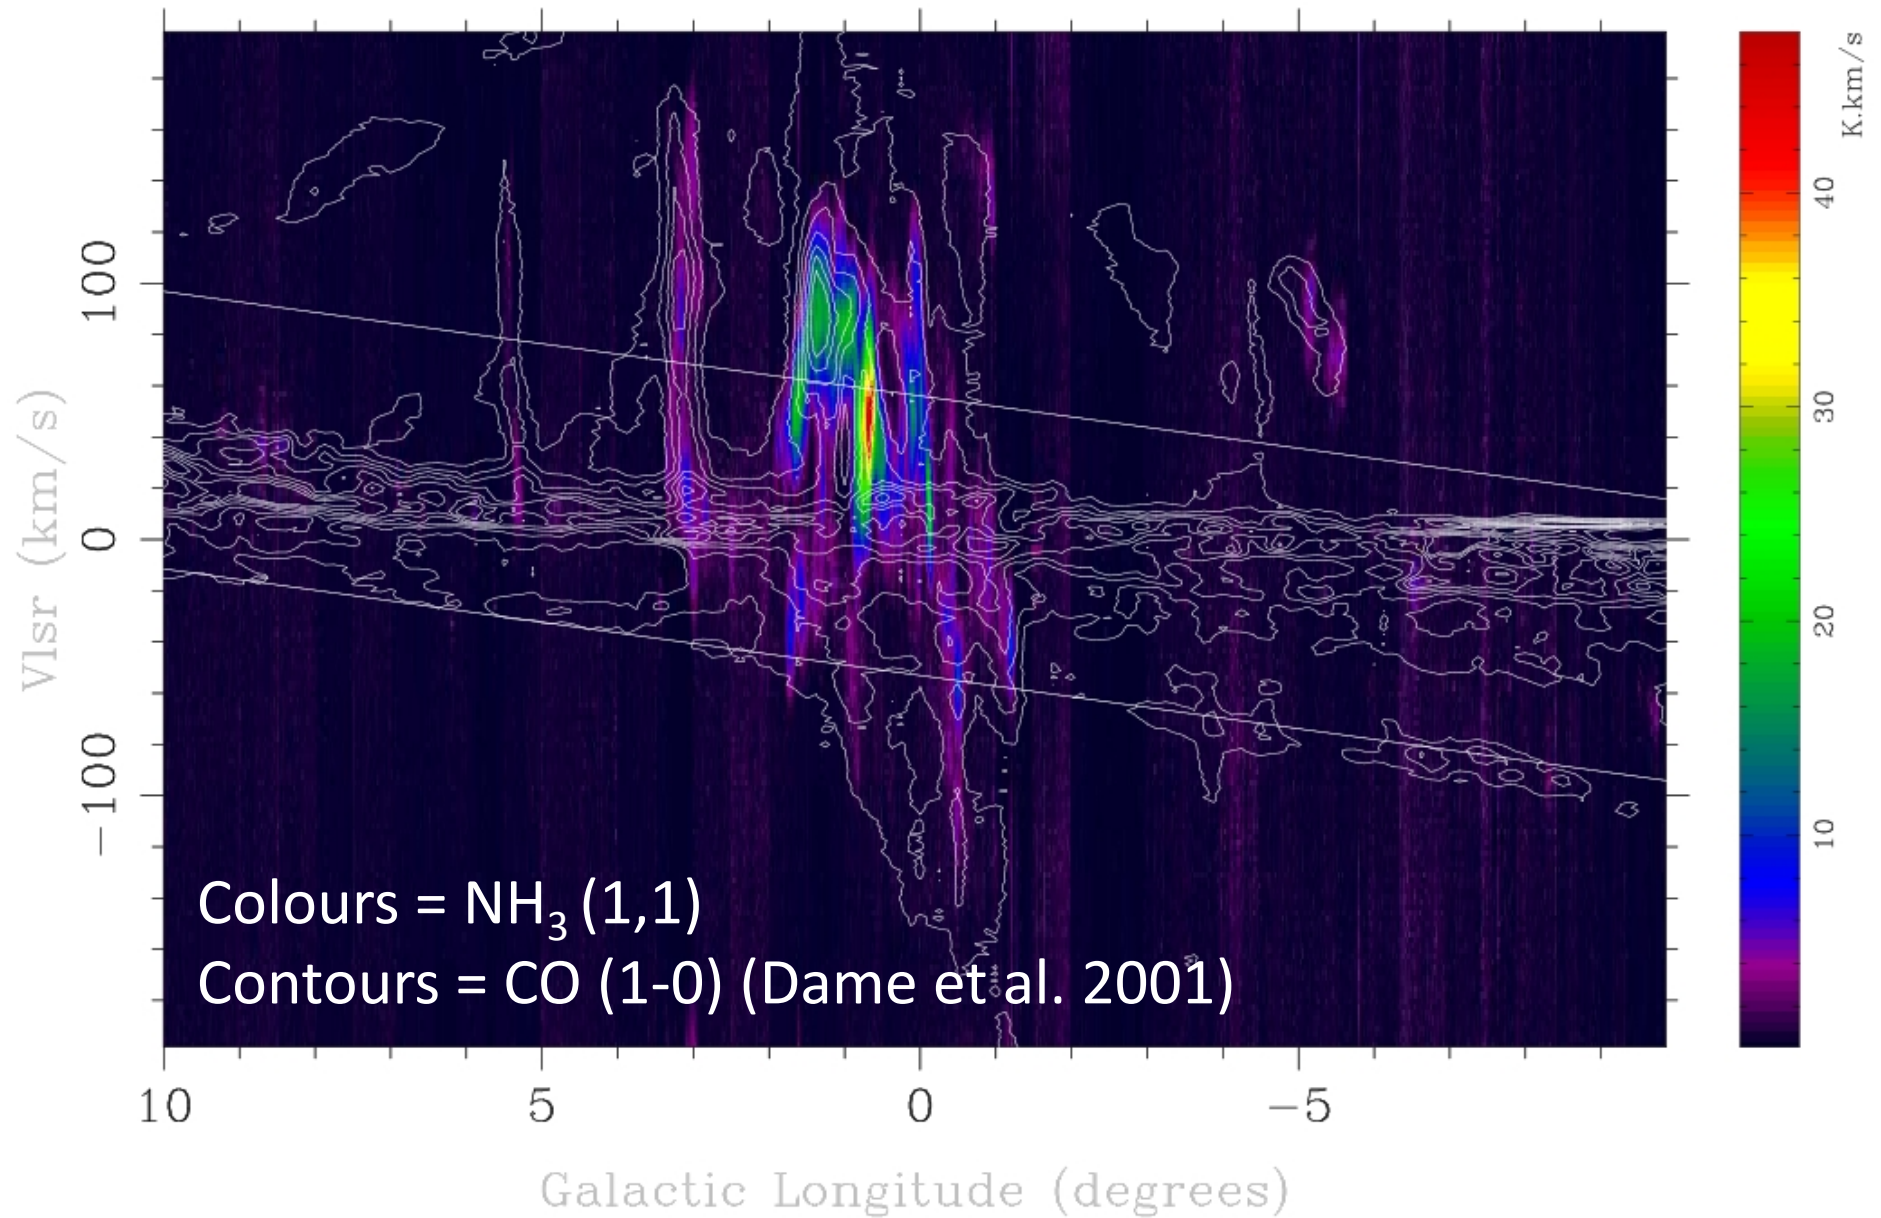

NH_3 (9,9)

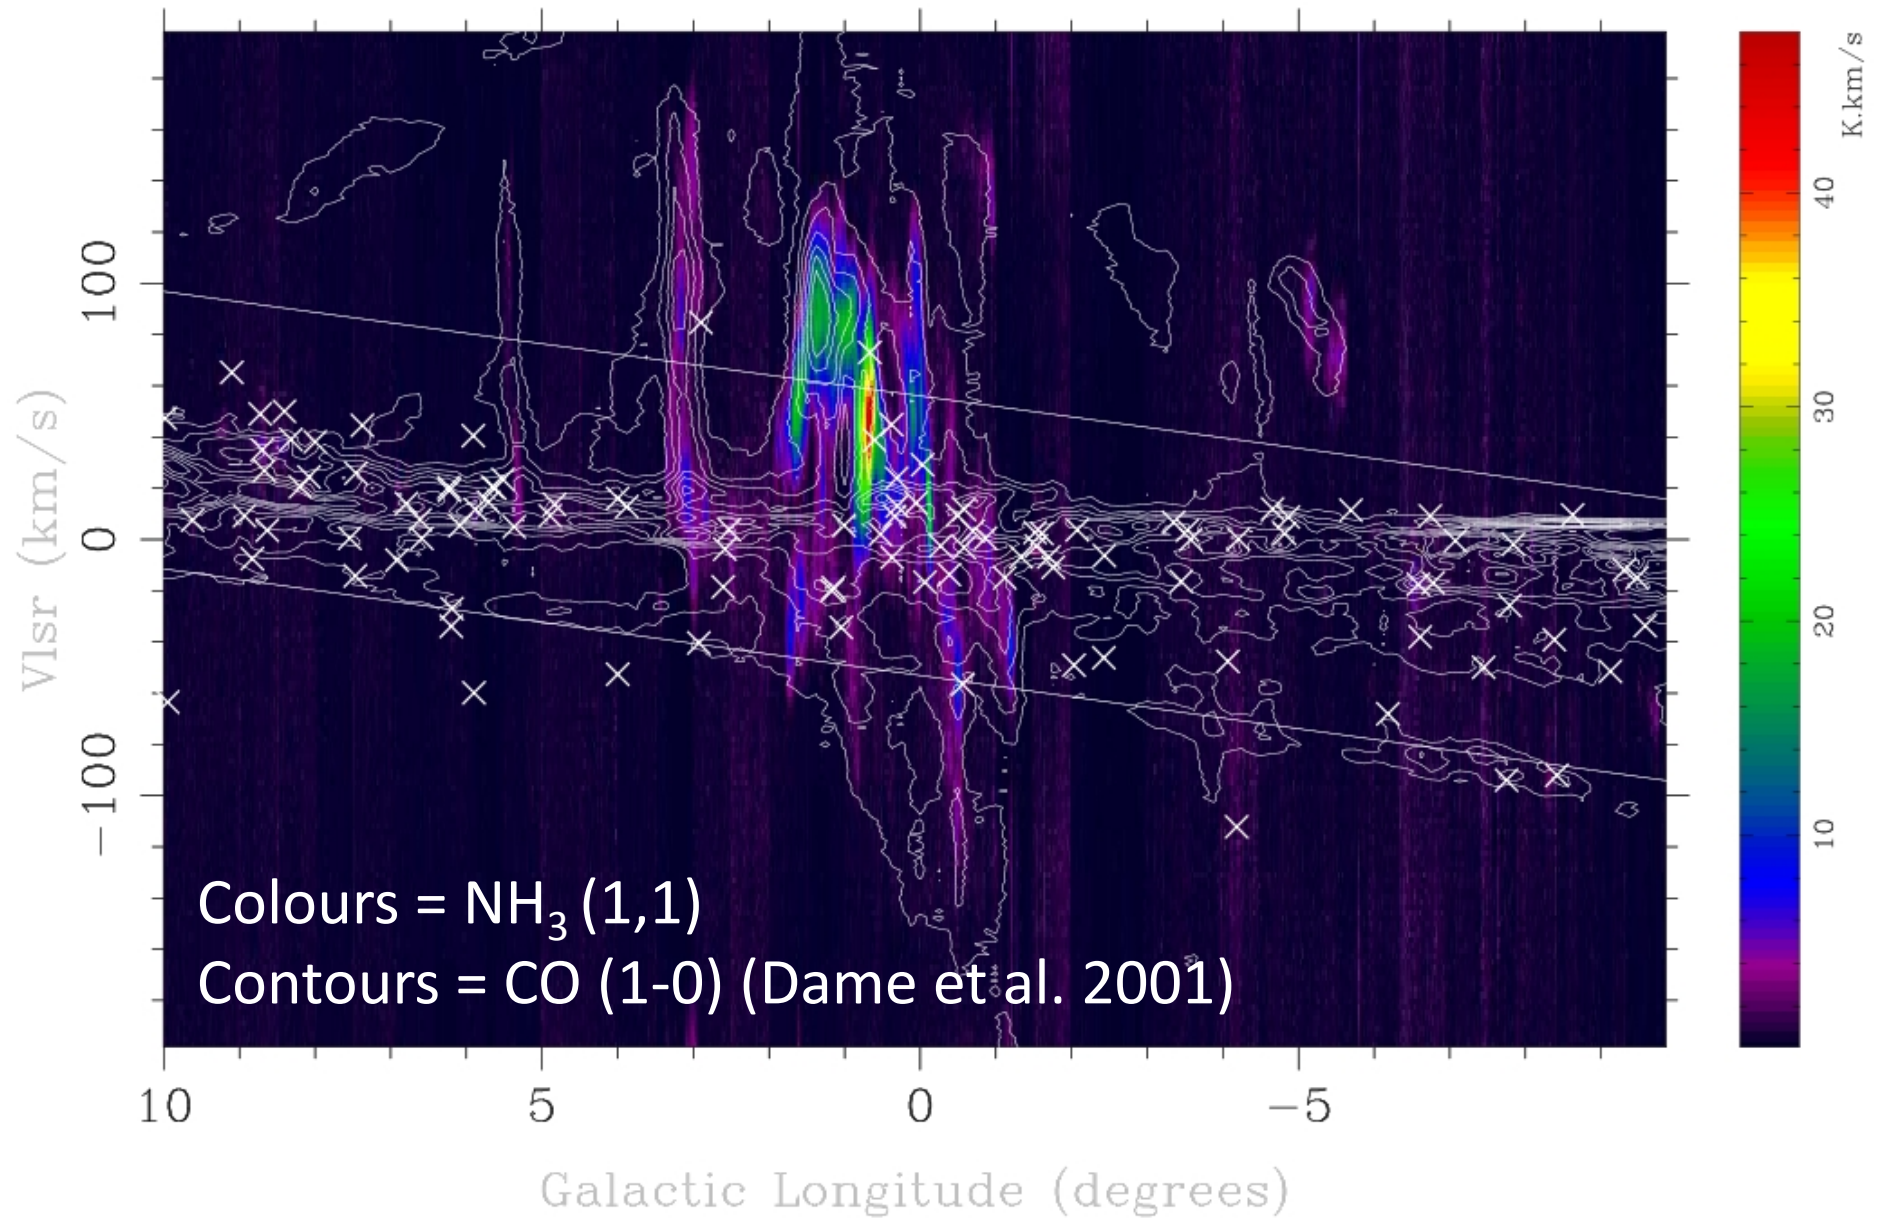

↔
50pc

Kinematics of the Inner Galaxy with NH_3

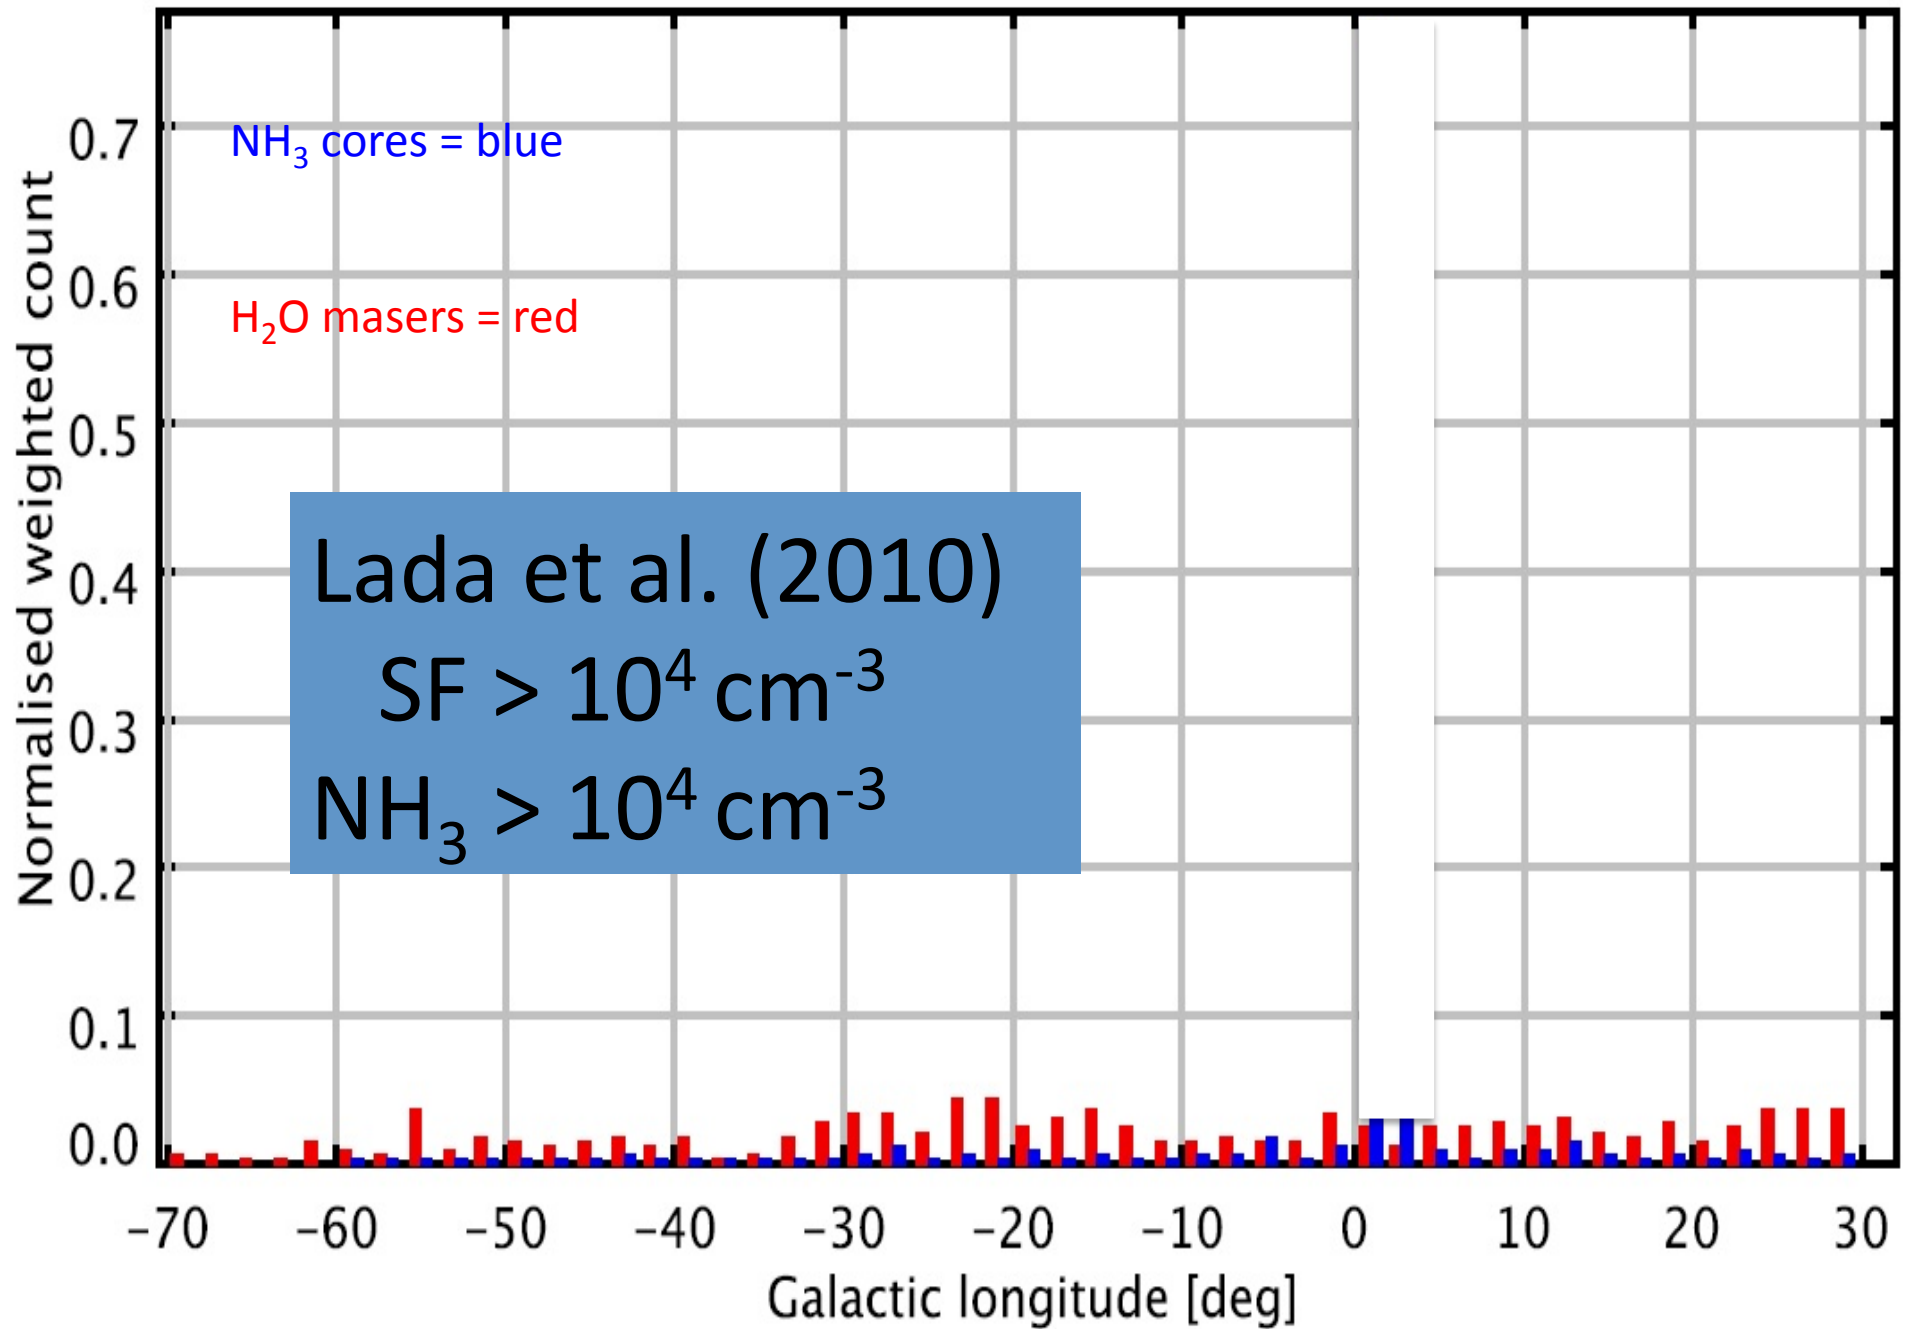

Kinematics of the Inner Galaxy with NH_3

Water masers

$\text{NH}_3(1,1)$ integrated intensity [dense molecular gas]

Large number of surveys in recent years searching for high mass protoclusters

Based on measured gas density these seem destined to predominantly form Open clusters

G0.253+0.016 – the initial conditions of a young high mass cluster?
(aka “The Brick”, “The Lima Bean”, “M0.25”, “Mr Hankey”)

Longmore et al 2011 submitted

G0.25

- $1.4 \times 10^5 M_{\text{sun}}$
- Radius 2.8pc
- Almost no signs of current star formation
- Gravitationally-bound so likely to form stars
- Potentially unique in Galaxy?

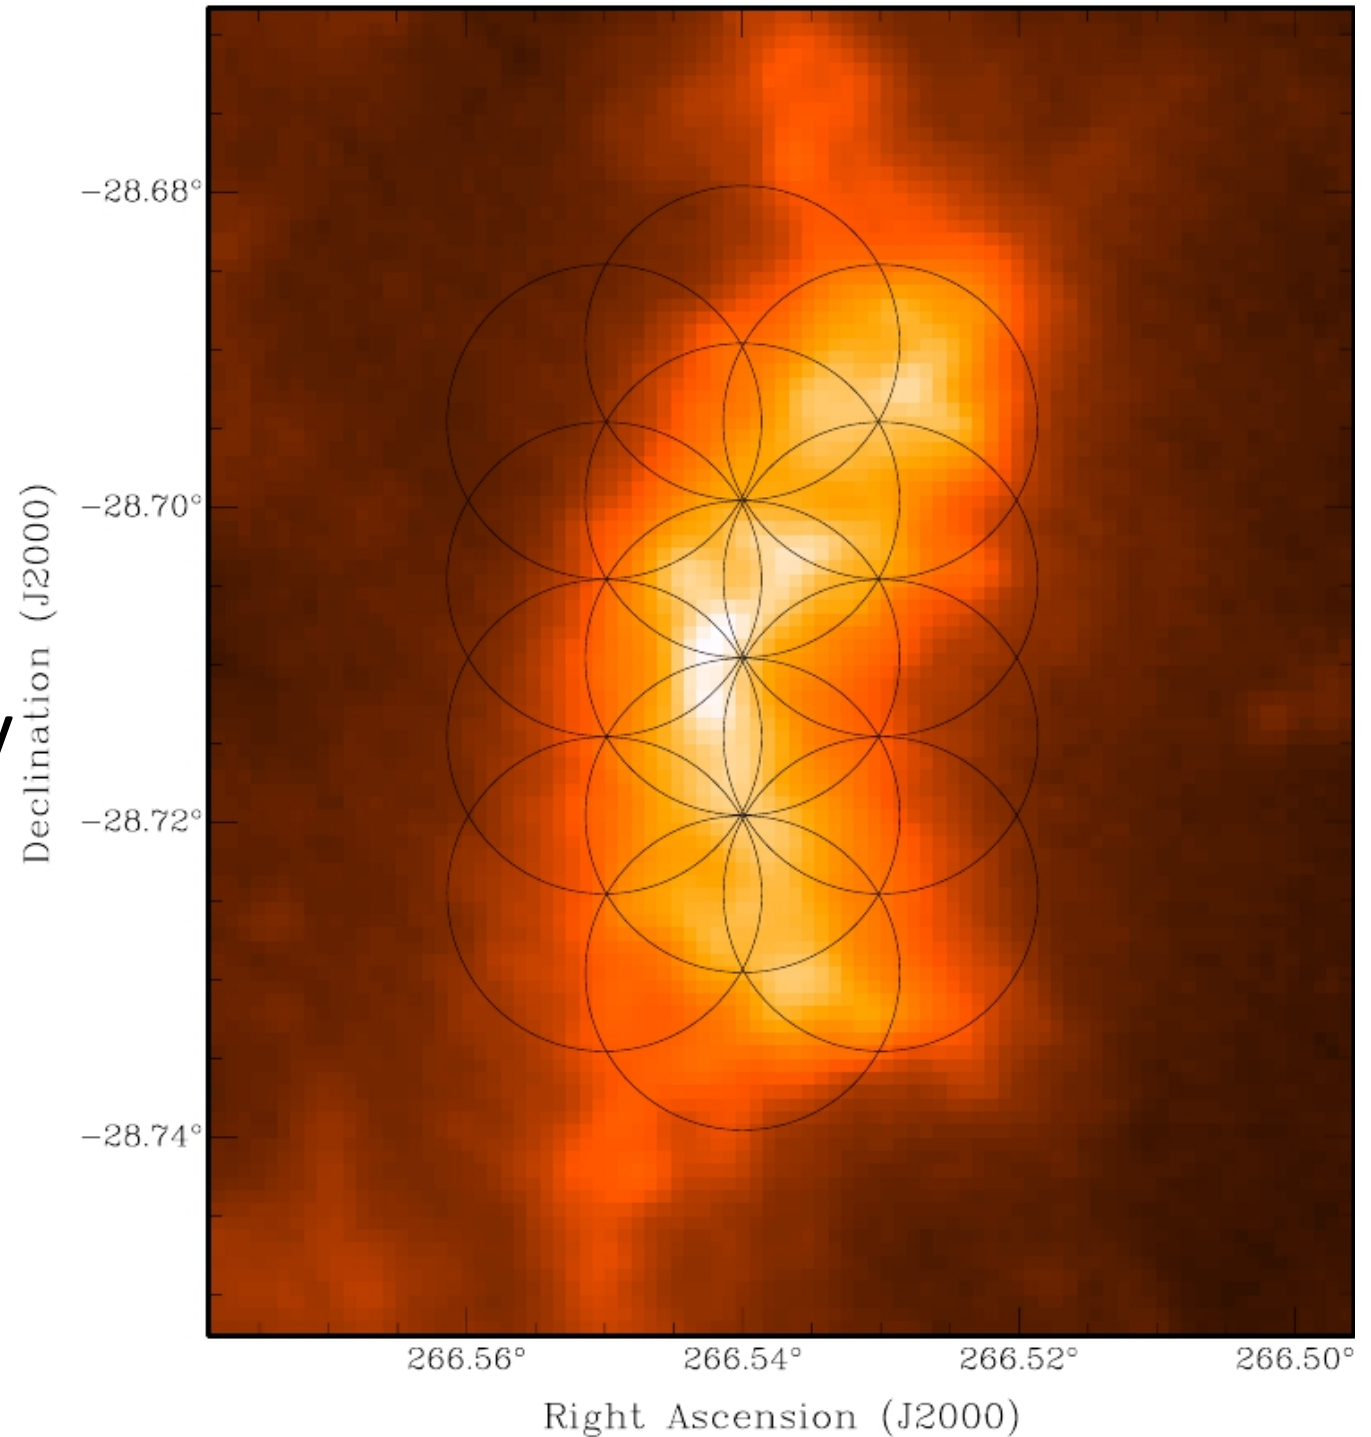

Initial conditions
of a precursor to a
YMC

Detailed study can reveal important
information about YMC formation and
help test theoretical models

ALMA Follow UP

- Awarded 6 hours of ALMA Early Science time to map G0.25 at 90GHz

Accurate positions of water masers using ATCA

Processed data from $l=10$ to $l=25$, including 90 water masers

Mosaic of GLIMPSE infrared around water maser positions

Mosaic of GLIMPSE infrared around water maser positions

Star formation associations

Mosaic of GLIMPSE infrared around water maser positions

Evolved star associations

Mosaic of GLIMPSE infrared around water maser positions

Unknown associations

Mosaic of GLIMPSE infrared around water maser positions

- 63 (70%) associated with star formation
- 20 (22%) associated with evolved stars
- 7 (8%) unclear associations

HOPS Summary

- Mopra observations of 100 square degrees finished
- 540 water masers (64% new)
- 568 NH_3 (1,1) detections
- $\sim 30\%$ of NH_3 (1,1) sources also show NH_3 (2,2) and NH_3 (3,3)
- Occasional detections: HC_3N (3-2), RRLs, multiple Class I methanol masers, HC_5N , NH_3 (6,6) and (9,9)
- Lack of star formation in the CMZ?
- High mass precursor for cluster
- ATCA followup complete; 90 masers processed (70% SF, 22% ES, 8% ?)

MALT – The Millimetre Astronomy Legacy Team

Three Galactic Plane Surveys

- A 3mm spectral line survey at 90GHz – MALT-90
- A 3mm spectral line survey at 115GHz – MALT-115
- A 7mm spectral line survey at 45GHz – MALT-45

MALT – The Millimetre Astronomy Legacy Team

A 3mm spectral line survey at 90GHz – MALT-90

- Focusses on emission from many strong spectral lines: N_2H^+ , ^{13}CS , $\text{H}41\alpha$, CH_3CN , HC_3N , $^{13}\text{C}^{34}\text{S}$, HNC , HC^{13}CCN , HCO^+ , HCN , HNCO , C_2H , SiO , H^{13}CO^+ and H^{13}CN
- 3000 cores throughout the Galaxy based on ATLASGAL continuum sources

MALT – The Millimetre Astronomy Legacy Team

A 3mm spectral line survey at 115GHz – MALT-115

- Focuses on emission from CO isotopologues: ^{12}CO , ^{13}CO , C^{18}O
- Survey requires some sort of fast mapping, which can be accomplished by sampling very quickly or spacing observations over many beams.

MALT – The Millimetre Astronomy Legacy Team

A 7mm spectral line survey at 45GHz – MALT-45

Use the ATCA rather than Mopra:

- Increase sensitivity/speed
- Use cross-correlation data to position masers
- Use auto-correlation data to map extended emission

MALT-45 Pilot Survey

Thanks to:

Chris Jordan (JCU/ATNF)
Vicki Lowe (UNSW/ATNF)
Maxim Voronkov (ATNF)
Cormac Purcell (U. Leeds)

MALT-45 Pilot Survey

Observations in March 2010 over 3×12-hour tracks on ATCA

- Map a one-square-degree patch of the Galactic Plane
- Fast mosaicing mode (6 seconds per pointing)
- Observe multiple spectral lines (42.2-44.2GHz & 47.2-49.2GHz)

MALT-45 Pilot Survey

Multiple spectral lines

- CS and C³⁴S (1-0) high density gas tracer. Also enhanced in outflows (compare to NH₃ from HOPS)
- CH₃OH Class I maser – strongest Class I transition at 44.069GHz. Typically shows up in shocked gas/outflows, but occasionally found close to Class II masers.
- SiO (1-0) masers: multiple vibrationally excited masing transitions – star formation + evolved stars.

MALT-45 Pilot Survey

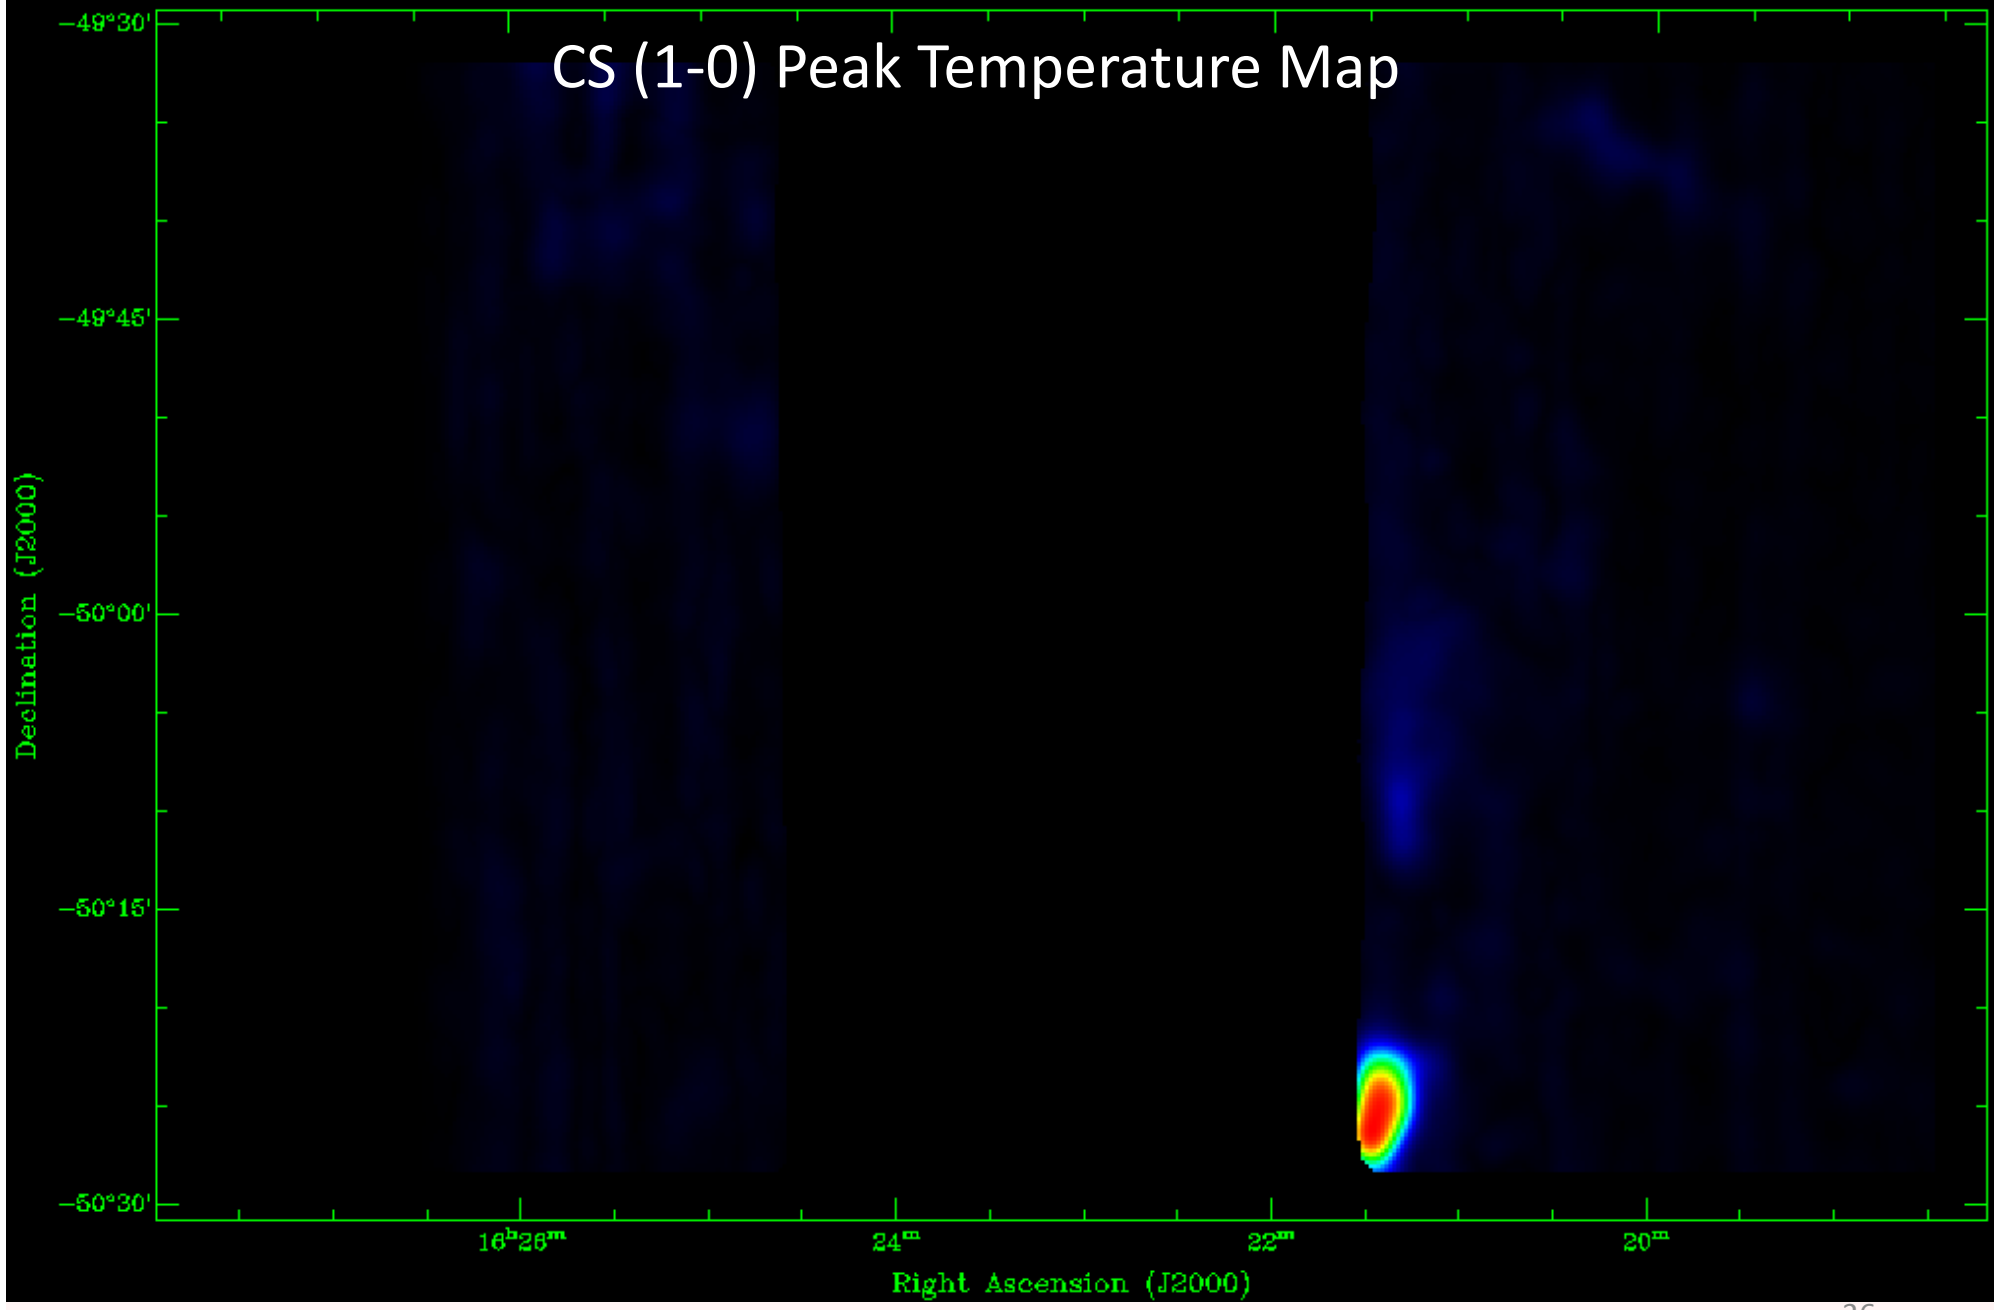

Continuum

- Identify hypercompact HII regions: very small signatures of HMSF seen only at high frequencies.
- Use CABB: can get spectral index from 42.2 – 49.2GHz

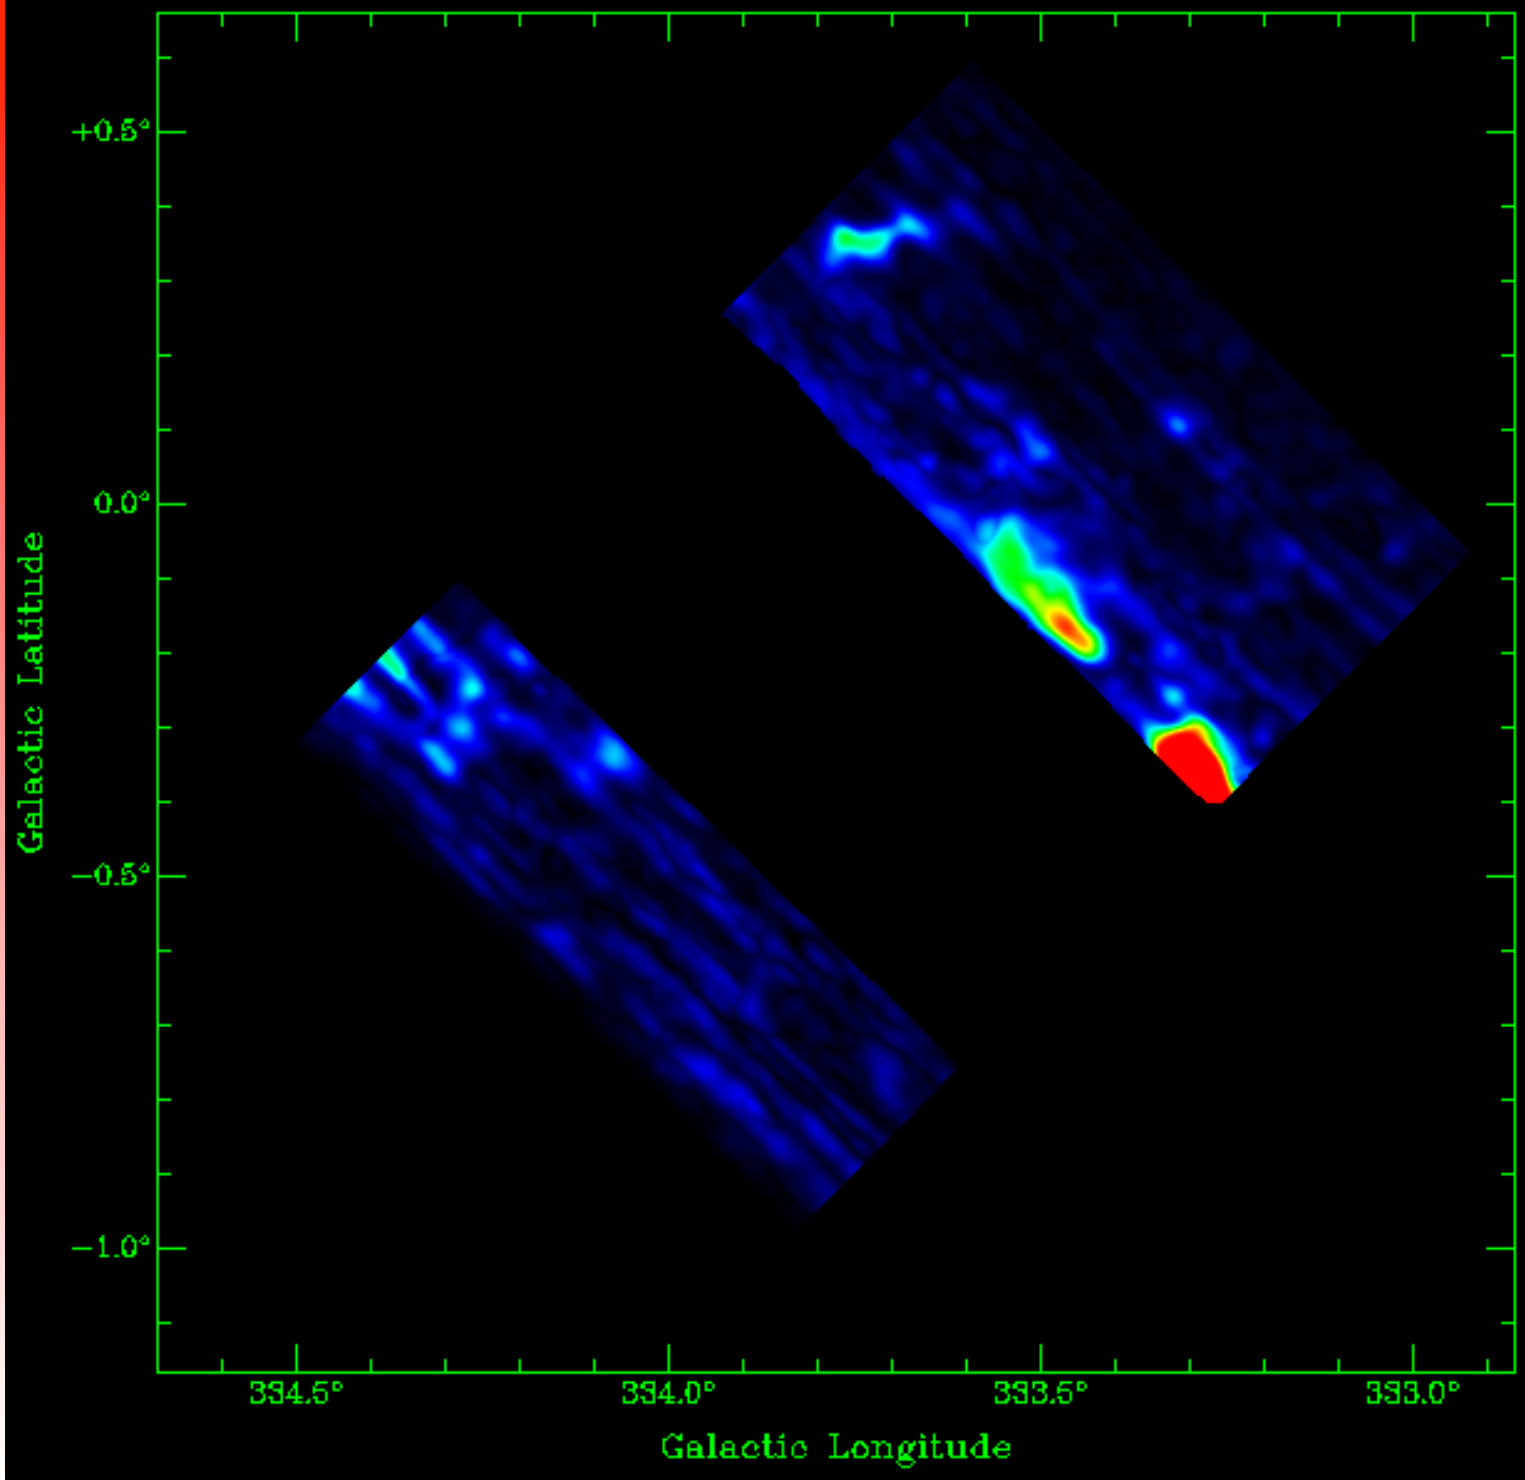

MALT-45 Pilot Survey

Results

- **CS(1-0) maps**
- **Comparison with HOPS NH₃ (1,1)**
- **Comparison with GLIMPSE infrared**
- **Class I CH₃OH masers**
- **SiO (1-0) v=1,2 masers**

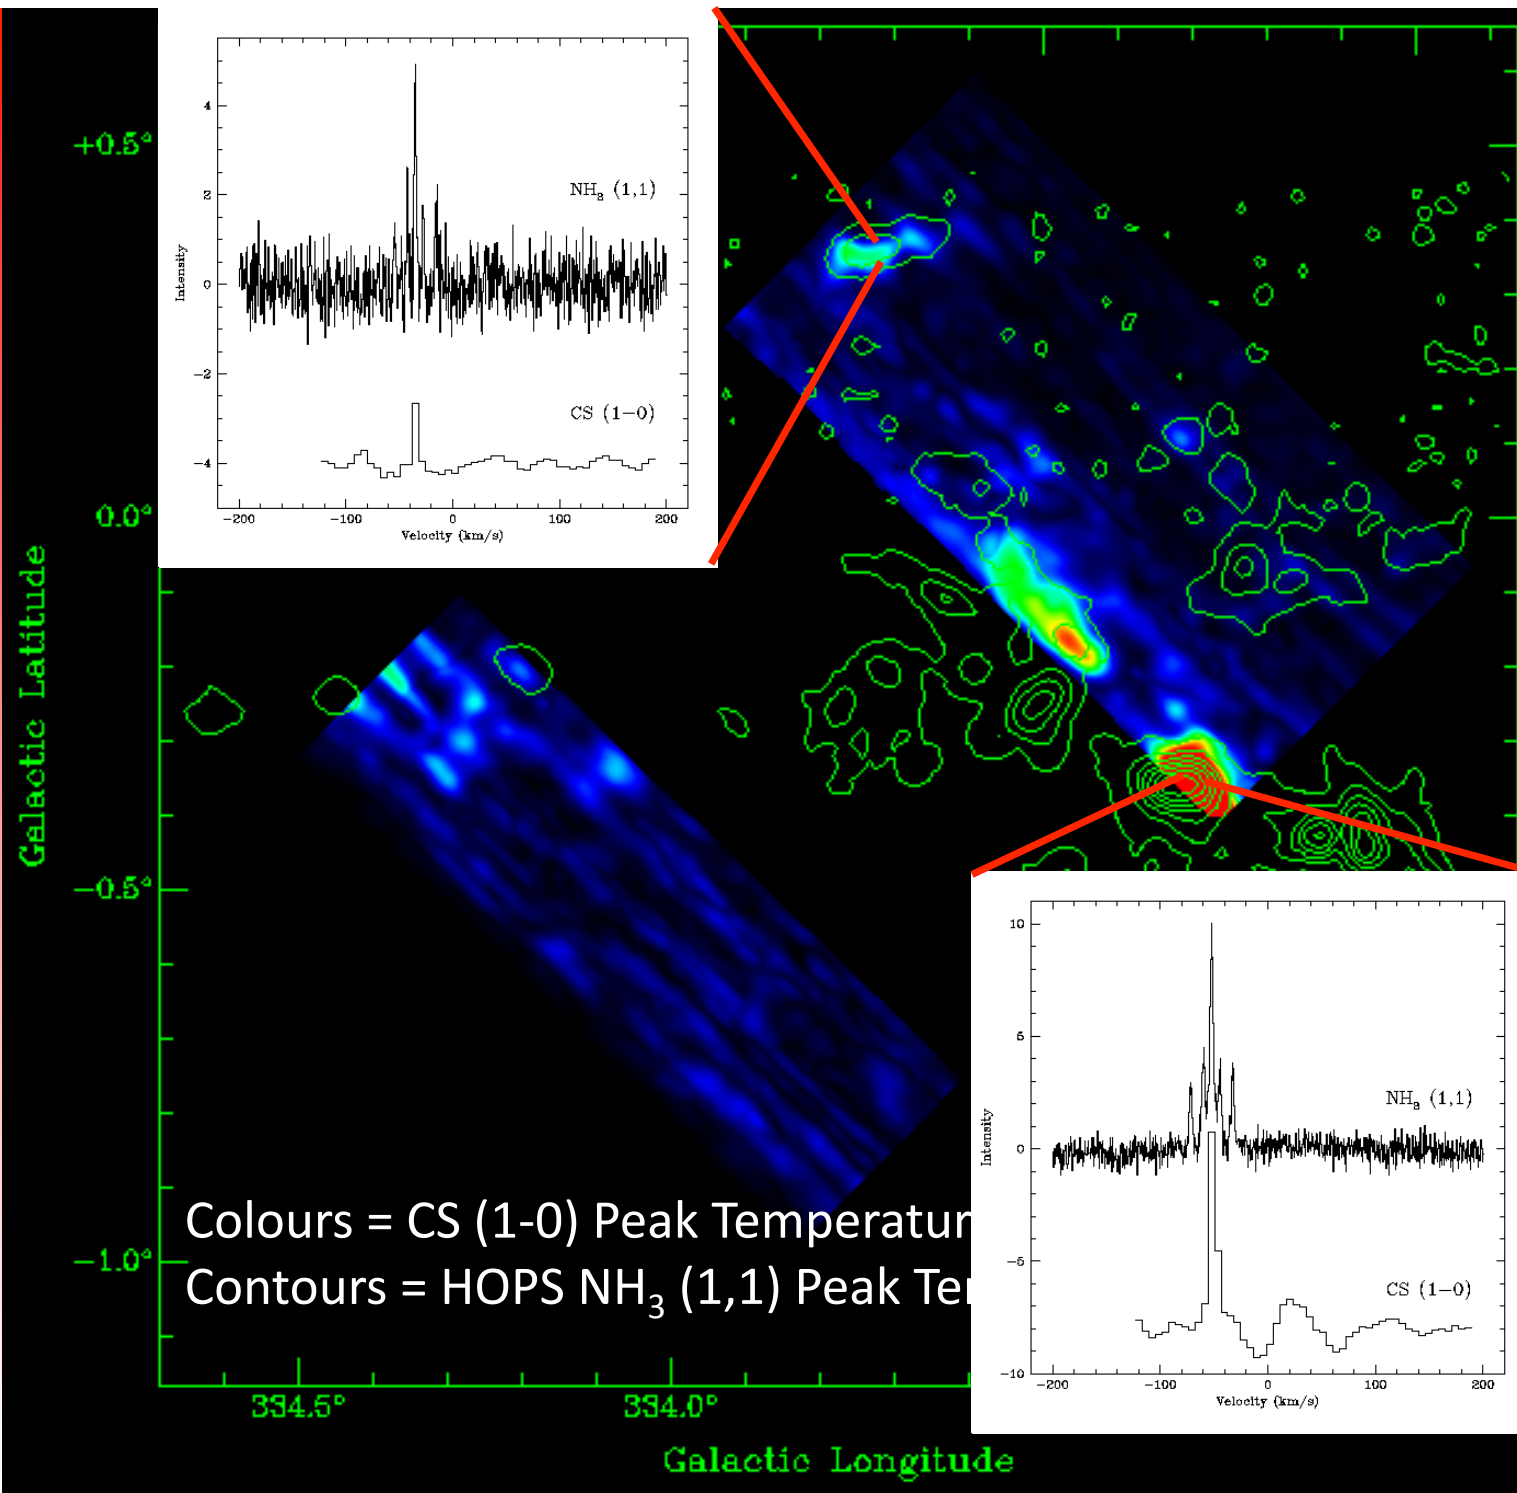

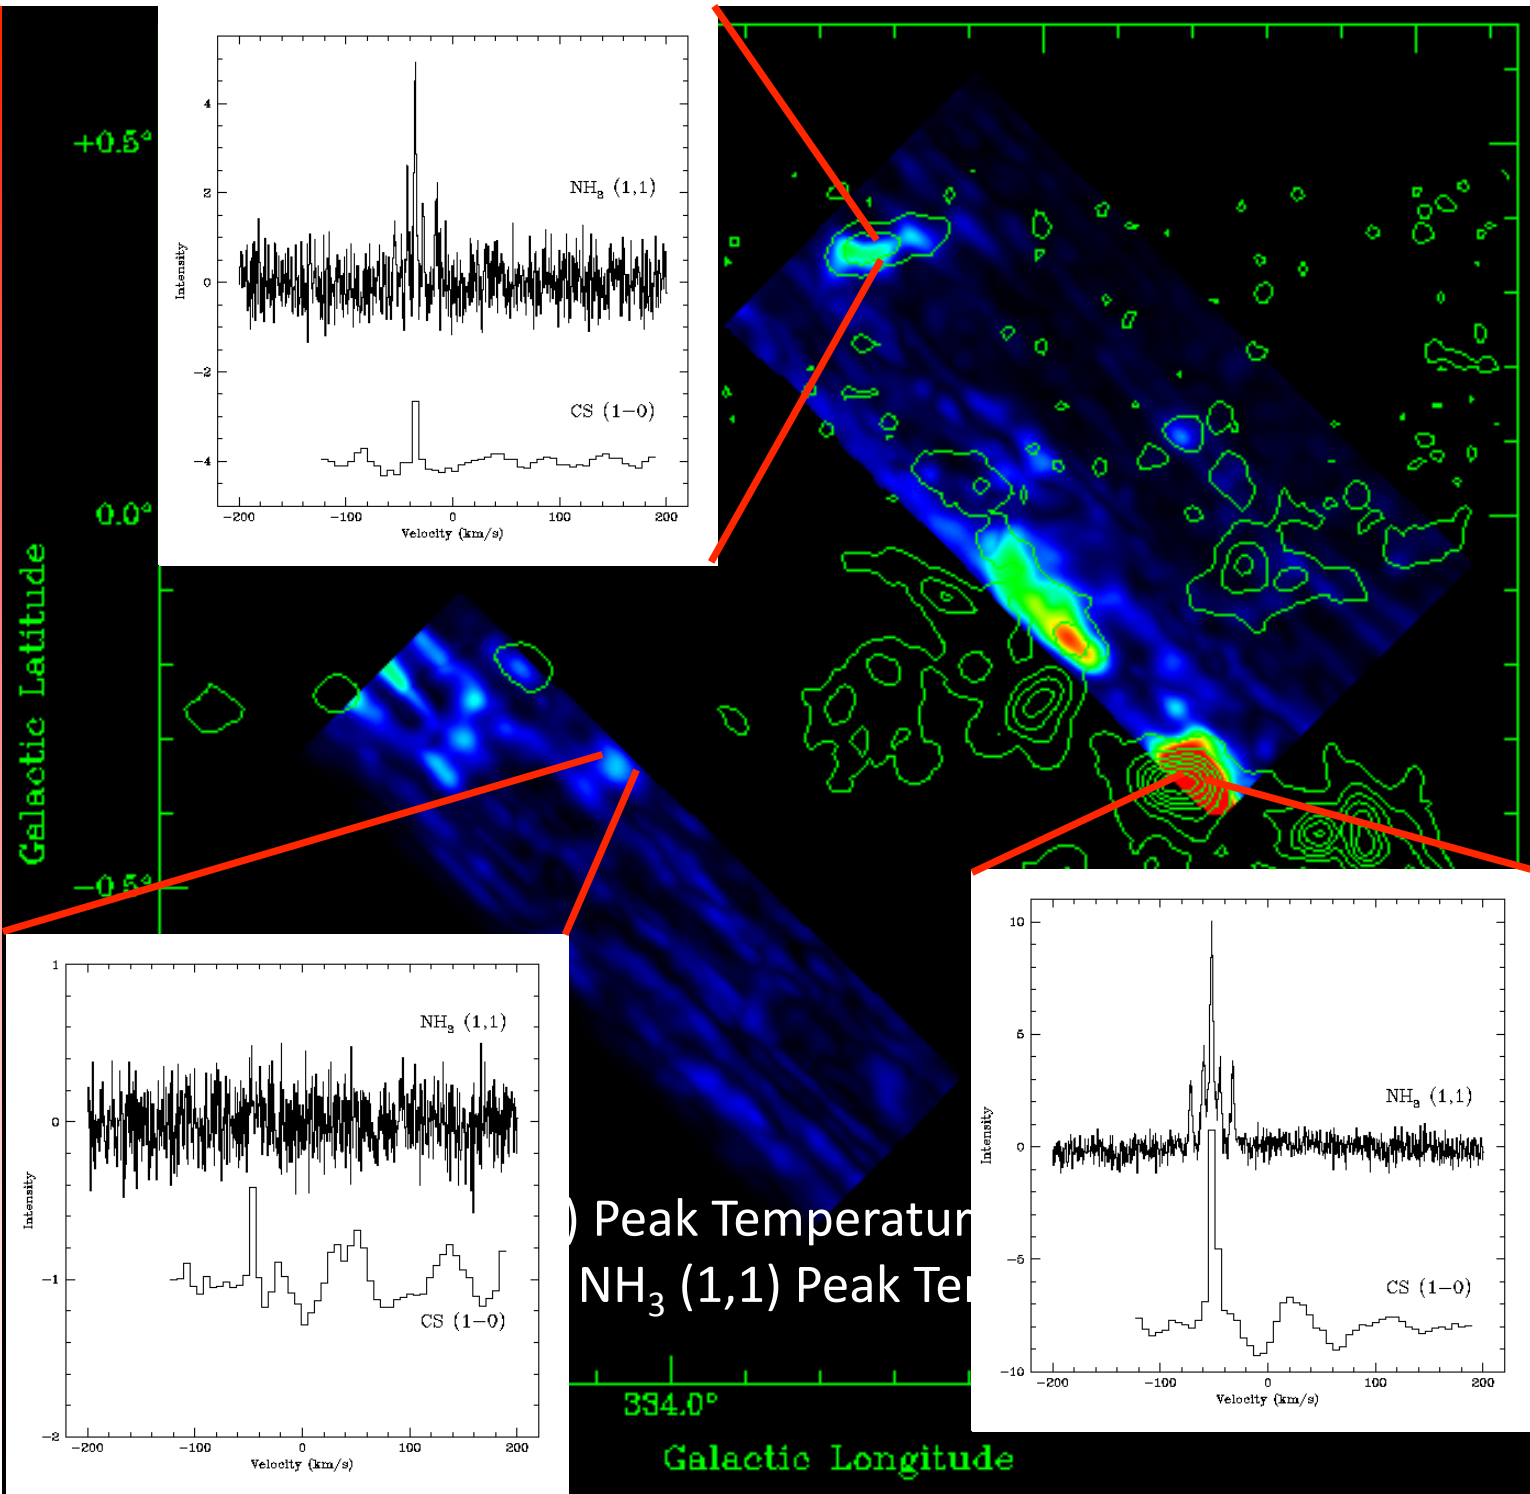

Close correspondence:

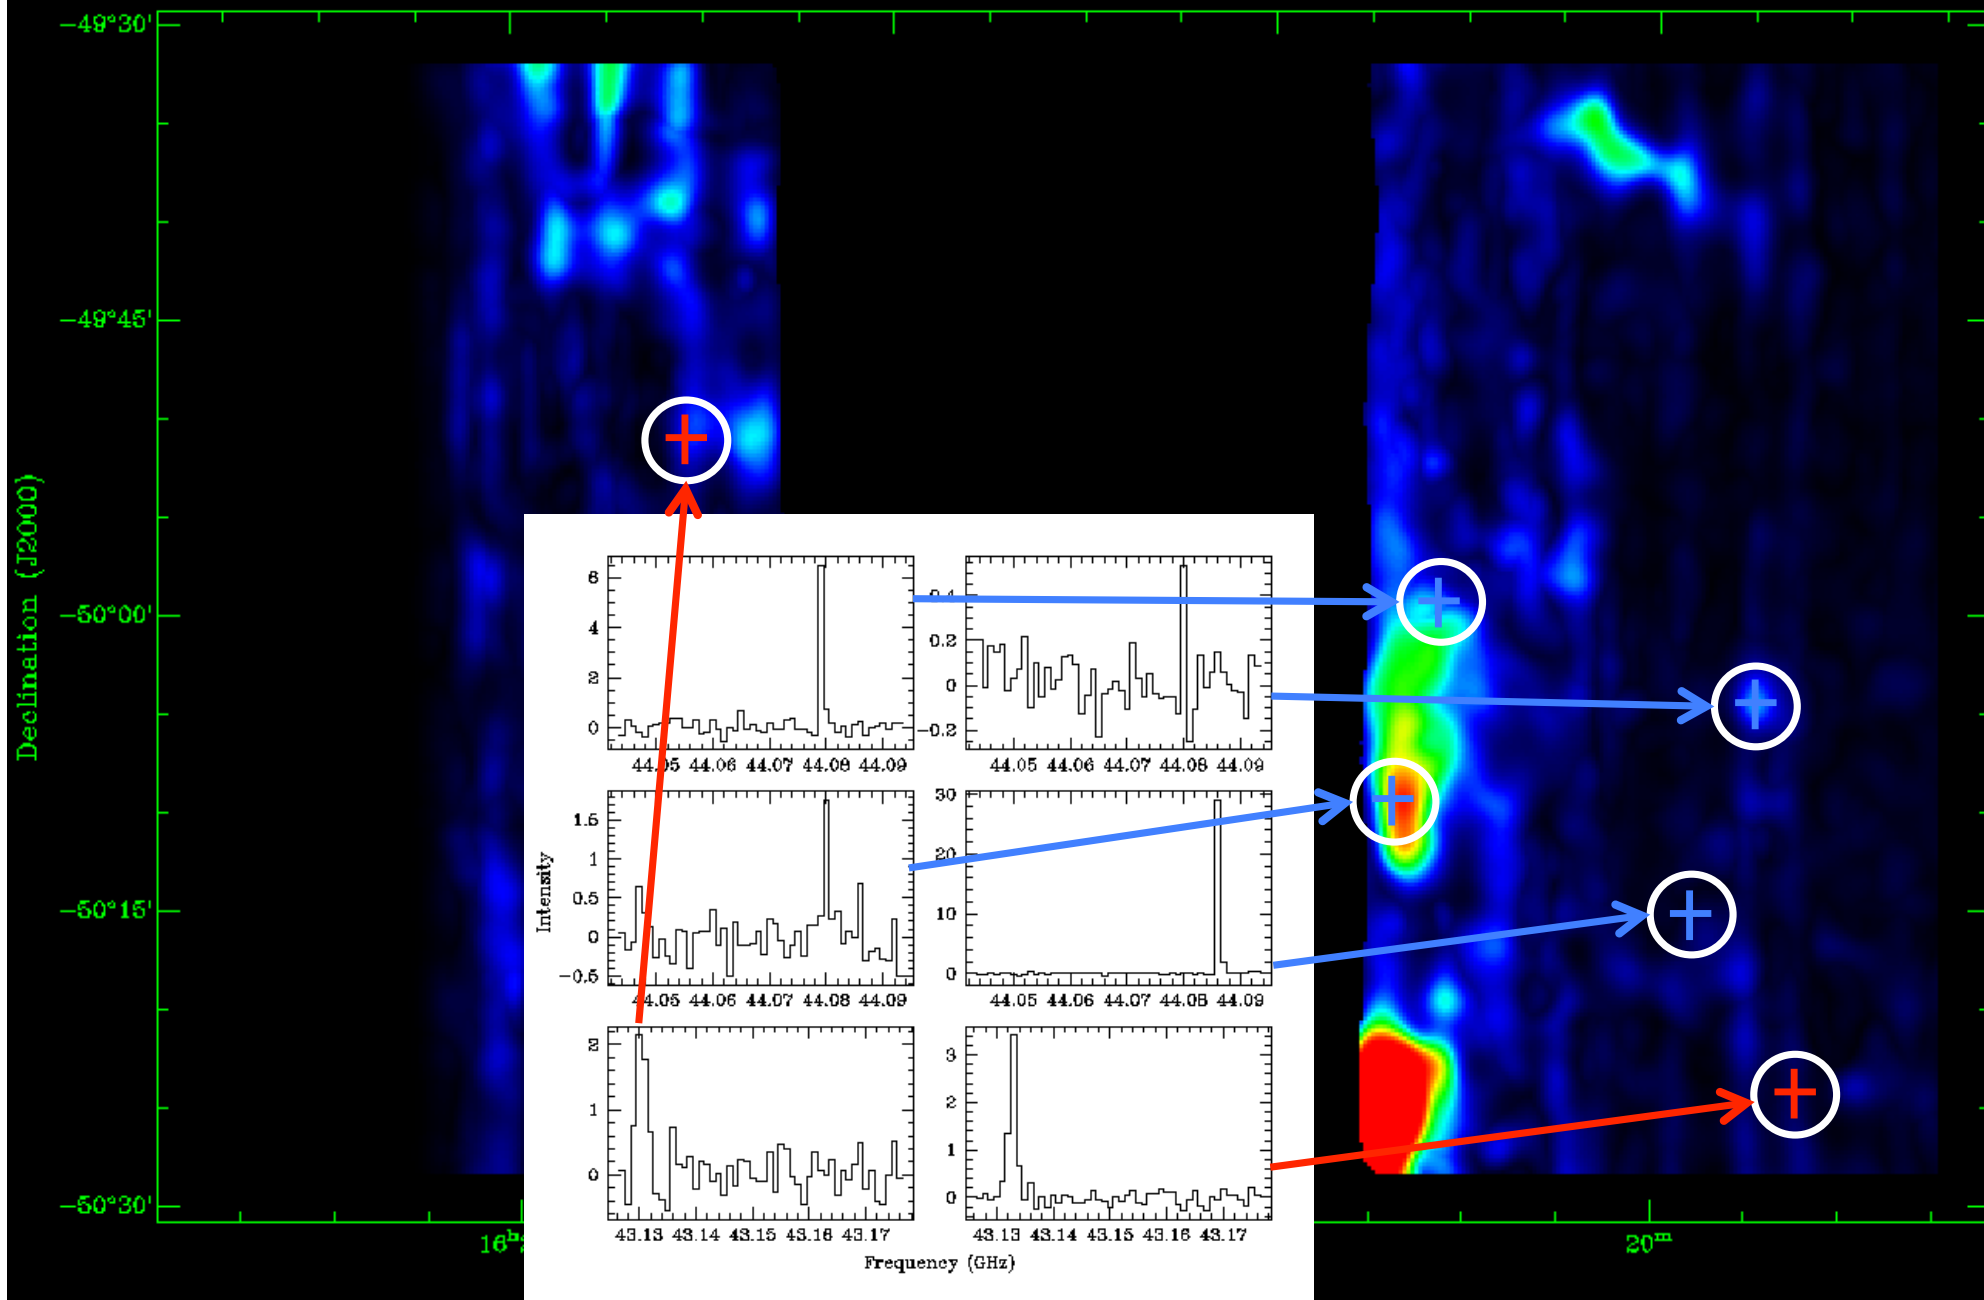

- CS (1-0) from MALT-45 Pilot
- NH₃ (1,1) from HOPS
- IRDCs from GLIMPSE

Possible differences in CS and NH₃

CH₃OH and SiO Masers

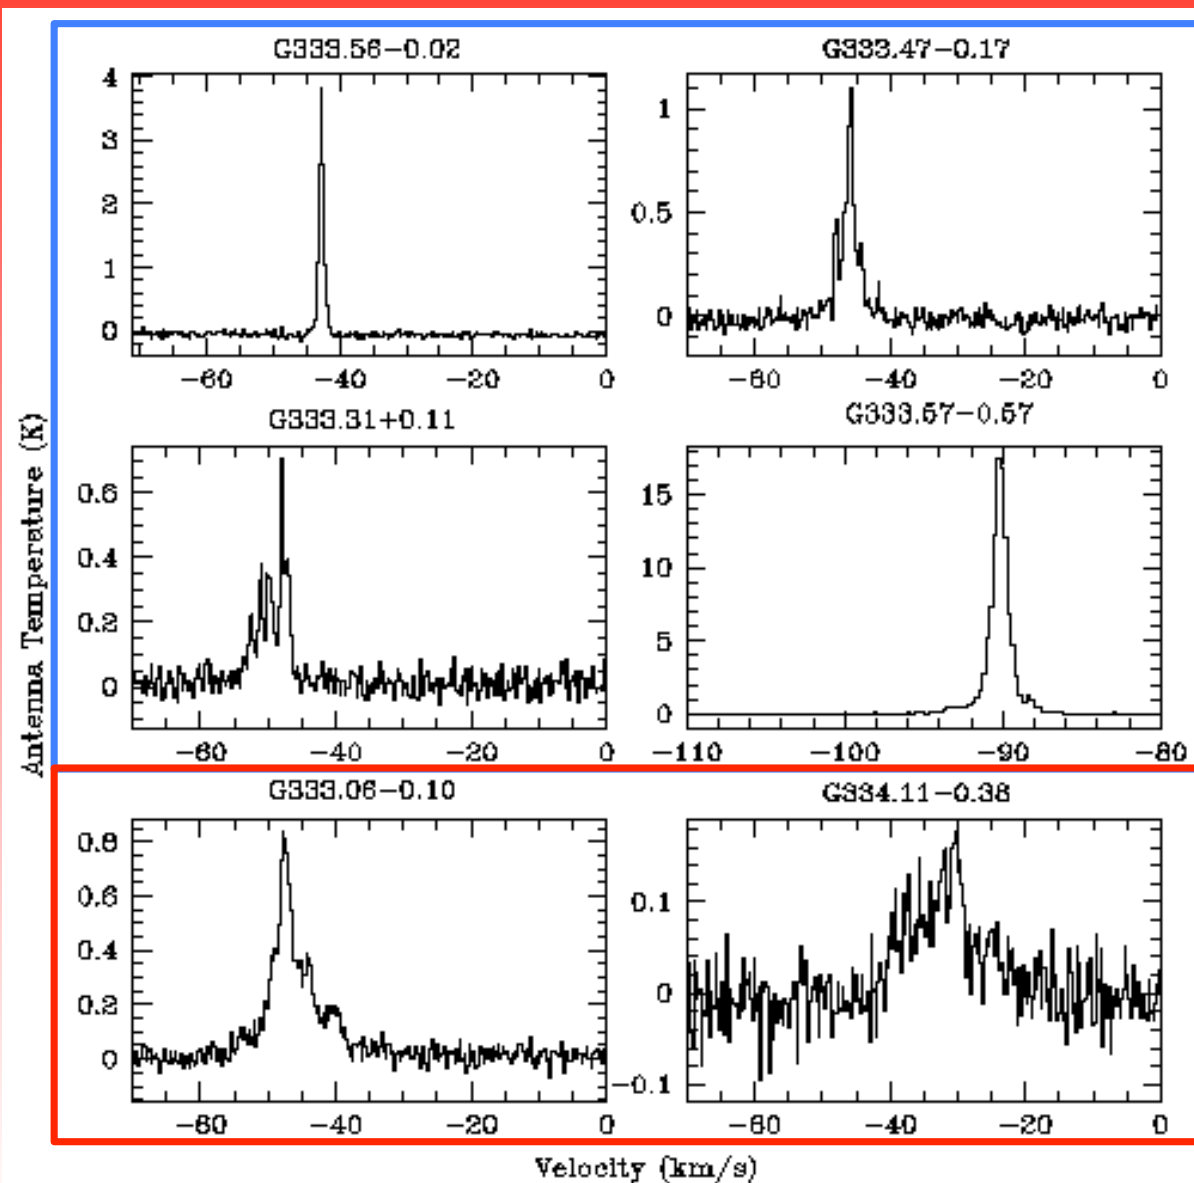

CH₃OH and SiO Masers

CH₃OH and SiO Masers

Mopra spectra

MALT-45 Pilot Summary

7mm ATCA observations successful in March 2010

Autocorrelation works on the ATCA

Things to do:

- Better baseline subtraction
- Extract continuum data
- More OTF mapping tests
- How will zoom modes improve the data?

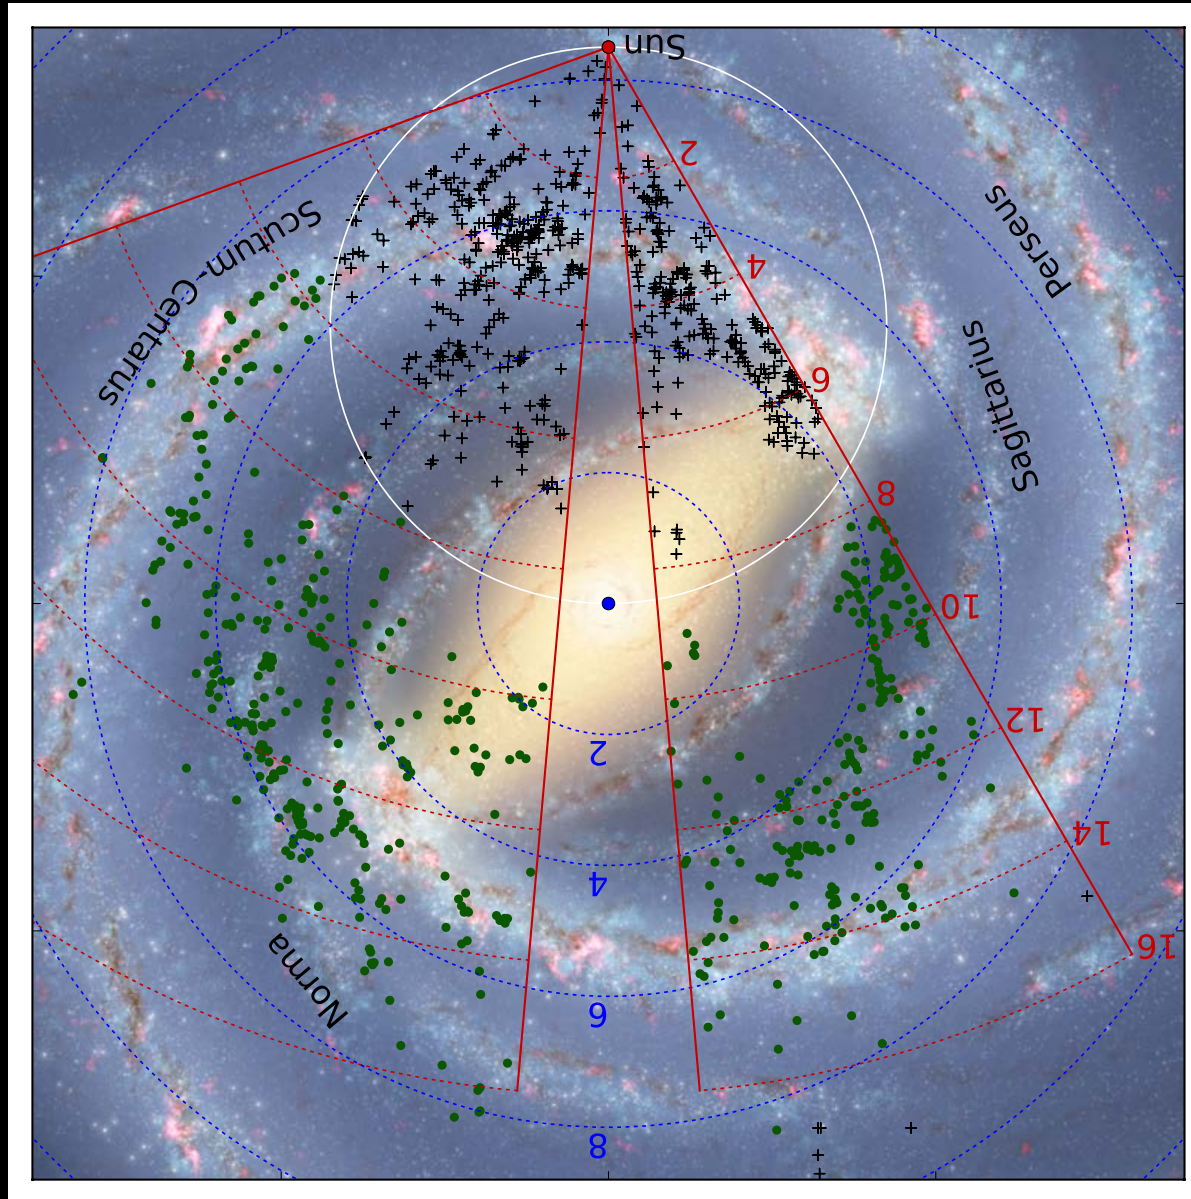

MALT-45 Pilot Summary

Full MALT-45 survey will be 45 square degrees:

$$l=330^\circ - 0^\circ - 15^\circ \quad |b| < 0.5^\circ$$

CS (1-0), Class I CH₃OH masers, SiO (1-0) masers,
RRLs and continuum

CCAT Synergies

CCAT Synergies

- CCAT is ideally suited to sensitive Galactic plane surveys relevant to star formation

- High density tracers to map the structure of star

CCAT needs a multi-element
(~100), multi-spectral line

- instrument to do this

gas (CH_3CN) and ionised gas (RRLs)

),
