SHARC II Electronics

C. Darren Dowell, Jeff Groseth, Matt Gardner

Caltech

ABSTRACT

This document is intended to describe the amplifiers, thermometry, and wiring of SHARC II. It does not include information on the A/D and data acquisition systems and software.

1. Amplifier and Readout Varieties

There are two sets of amplifier electronics. The first uses OP470's in a single ended configuration (one signal per op amp). (ADD FIGURE LATER.) The second uses AD624's in a differential configuration (two signals per in amp). (ADD FIGURE LATER.) The sensible readout possibilities are thus:

1) Single-ended (OP 470)

1A) Secondary chopping at ~3 Hz with DSP demodulation.

1B) Secondary chopping at ~3 Hz with hardware demodulation.

1C) Total power readout with ~30 Hz AC bias and hardware demodulation, with or without slow secondary chopping.

2) Differential (AD 624)

2A) Pixel differencing with ~3 Hz secondary chopping, DSP demodulation.

2B) Pixel differencing with ~3 Hz secondary chopping, hardware demodulation.

2C) Pixel differencing with ~30 Hz AC bias and DSP demodulation, with or without slow secondary chopping.

2D) Pixel differencing with ~30 Hz AC bias and hardware demodulation, with or without slow secondary chopping.

Selecting between DSP and hardware demodulation is straightforward. The frequency reference to the AD630 demodulators must be changed from square wave to DC, and the DSP must change from demodulation mode to averaging mode. Since it desirable to have low pass filtering before

the A/D, we may not use readout mode 2C. It is difficult to preserve the signal content with a 30 Hz fundamental and still filter out frequencies above 1 kHz effectively.

2. Bias Generation

3. Amplifer Thermometry and Control

JFETs must be heated to operating temperature. To minimize digital I/O, use simple switches to activate/deactivate heaters.

4. Dewar Thermometry and Control

5. Amplifier Motherboard Layout

See Figure 1.

6. 78-pin Connector Pinout

See Table 1. The signal and reference numbers in the leftmost columns are labels for the motherboard only and do not necessarily correspond to bolometer numbers.

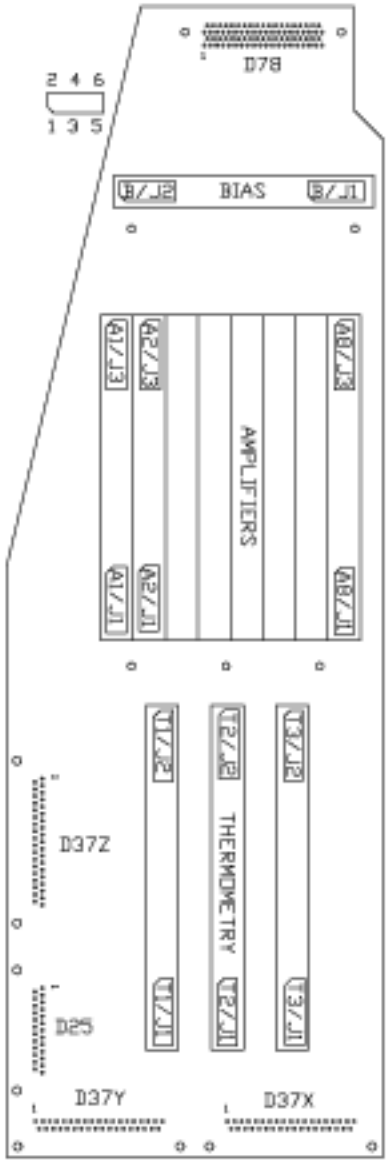

Fig. 1.— Connector locations on SHARC II motherboard. Note labeling convention for 2-row 0.1" connectors.
